# FAOSTAT 3.0

# A revitalisation of the API wrapper of the FAOSTAT API

Sebastian Campbell

March 1, 2024

The FAOSTAT package is an important part of the Food and Agriculture Organization (FAO)'s image that is being maintained, but requires a makeover. Here an updated version, 2.3.0, of the package is presented with repaired access to FAO's API, new functions and preparation for a complete overhaul in 3.0.0. The package has been modernised according to new coding conventions with improved dependencies, documentation and tests. Old useless functions have been pruned and the package is now firmly focused on providing an interface to FAO data to users of R.

Important

The abstract needs to be updated to 3.0

#### Other formats

## HTML report | → PDF report | ご Presentation | ♠ GitHub

# **Project background**

The motivation for this project came from a Data Mining project from UniLaSalle. It was suggested that we use  $FAO^1$  data from

<sup>&</sup>lt;sup>1</sup> Food and Agriculture Organization of the United Nations

their statistical platform FAOstat<sup>2</sup>. As R was the language of choice, the obvious port of call was the FAOSTAT package<sup>3</sup> (Kao, Gheri, and Gesmann 2022), developed by employees at FAO.

However, the FAOSTAT package did not work. It could not download data from the API<sup>4</sup> and could only download bulk data with the entirety of a dataset in one go. For the particular dataset we were interested in, we found that there was a discrepancy between the data in the bulk download and the data on the web platform.<sup>5</sup>

Eventually it became necessary to use the same API that the FAOstat website uses to pull data. This method worked and it became clear that it could be used to revitalise the FAOSTAT package and part of an effort to restore it to full functionality.

A first update, FAOSTAT 2.3.0 was released by the author in May 2023. FAOSTAT 3.0 is a continuation of that effort and realises many of the goals that it set out.

#### What's an API?

An API<sup>6</sup> is a method for a host application to allow a client to send it commands in a way the client understands. The API is a layer that converts these client commands to ones that the host understands. To use a metaphor, you could in theory drive a car by manually turning the axle to got left and start it by hitting a spark plug yourself. However, the key (or start button, if you have a newer model) and steering wheel are a much more natural and intuitive way to direct a car for a human being. However, from the car's perspective the axle gets turned and the spark plug is struck. The steering wheel and key essentially work as an API between the server (the car) and the client (the person).

In modern parlance, when we refer to an API, we usually mean a REST<sup>7</sup> API. This is a type of API run over the web via HTTP<sup>8</sup>, the same protocol that serves web pages. These APIs are a method of exchanging data and use the following major verbs<sup>9</sup> from HTTP:

**GET** - Request data from the server

• Request: GET https://example.com/johnsmith/info

<sup>&</sup>lt;sup>2</sup> Food and Agriculture Organization Corporate Statistical Database

<sup>&</sup>lt;sup>3</sup> For the purposes of clarity, this document will use the style "FAOSTAT" for the R package and "FAOstat" for the statistical platform

<sup>&</sup>lt;sup>4</sup> Application Programming Interface

<sup>&</sup>lt;sup>5</sup> This discrepancy has been fixed as of 2023-03-10

<sup>&</sup>lt;sup>6</sup> Application Programming Interface

<sup>&</sup>lt;sup>7</sup> REpresentative State Transfer

<sup>&</sup>lt;sup>8</sup> HyperText Transfer Protocol

<sup>&</sup>lt;sup>9</sup> There are other verbs (HEAD, CONNECT, OPTIONS, TRACE and PATCH), but they are of much lower importance

- Payload: None
- Response: {username: johnsmith, full\_name =
  "John Smith"}

#### **PUT** - Send data to the server

- Request: PUT https://example.com/johnsmith/info
- Payload: {full\_name: "John Allen Smith"}
- Response: None

#### POST - Send data to the server and receive data

- Request: POST https://example.com/johnsmith/send\_email
- Payload: {subject: "Business opportunity", body = "Dear {fullname}, please reply"}
- Response: {result: "success", send\_time: "2020-09-23 17:34:15"}

#### **DELETE** - Delete data from the server

- Request: DELETE https://example.com/johnsmith
- Payload: NoneResponse: None

The key innovation that REST introduces is *statelessness*. The server doesn't have to keep track of any previous requests. Each request is atomic and is considered in isolation. This distinguishes it from other API patterns such as SOAP<sup>10</sup> (Halili and Ramadani (2018)).

<sup>10</sup> Simple Object Access Protocol

#### **FAOstat**

FAOstat is FAO's web-based statistical platform for the free dissemination of food and agriculture statistics. This data is obtained from questionnaires that FAO distributes throughout the world every year (Food and Agriculture Organization of the United Nations 2019). Some of its data also comes from imputations and models where data is not available, but official country data takes precedence.

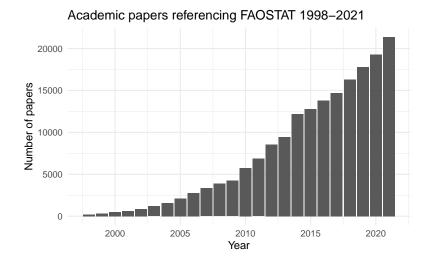

Figure 1: Academic papers referencing FAOSTAT over the last 25 years (Strobel 2018)

The FAOstat service is a public-facing aspect of FAO, with an overall trend of increasing citations in academic papers year on year with 21400 citations by 2021 (Figure 1).

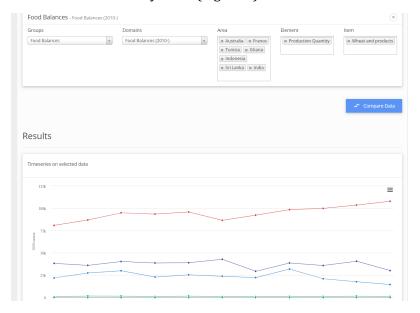

Figure 2: FAOstat interface for exploration of country data

This platform uses a REST API internally to communicate with its database as well as providing a set of zip files with the entirety of certain datasets in order to reduce the load on the database. This REST API allows the website to generate CSVs as well as to allow exploration of the data via interactive graphs (Figure 2).

# **FAOSTAT** package

The FAOSTAT package is an API wrapper to pull data from FAOSTAT into a R session. It can also perform small necessary tasks such as country code conversion and coalescing data from different country groups.<sup>11</sup>

# <sup>11</sup> For example, China may be just the mainland or may include Taiwan (Chinese Taipei), Hong Kong and Macao

# History

The FAOSTAT package was originally developed in 2013 as a tool to source data for the SYB<sup>12</sup> project. The yearbooks are yearly summaries of the worldwide state of agriculture for that year. At the time, they were manually typeset and compiled. The new SYB project was to use a combination of LaTeX, knitr and R to automatically pull data from FAOSTAT and other data sources such as the World Bank. This data would be then be transformed and processed to create graphs and tables before finally formatting and typesetting to create a finished product which could then be printed.<sup>13</sup>. Given that this use case no longer exists, the primary use of this package is for researchers and other R users to read data from FAOstat in a clean way that makes it easier to move to analysis afterwards.

It is a reasonably popular package; in the 86th percentile of all packages on CRAN on 2023-04-01 by downloads. In total, the package has been downloaded over 50 000 times with a peak 121 daily downloads on 2019-05-15. (Li 2023)

<sup>13</sup> The author has no insight into the current production of the SYB, but they are still being produced and can be found on the FAO website

## Maintainership

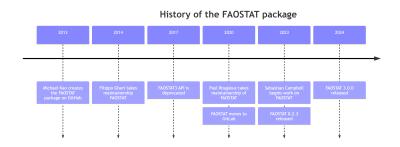

Figure 3: A timeline of the FAOSTAT package from its creation to today

<sup>&</sup>lt;sup>12</sup> Statistical Year Book

The package was maintained by Michael Kao, the author, from 2013 to 2014. In 2014, it was maintained by Filippo Gheri before passing to Paul Rougieux (the current maintainer) in 2020 (Figure 3).

While it was originally hosted on Github under Michael Kao's personal account, It is currently hosted on GitLab under Paul Rougieux's personal account.

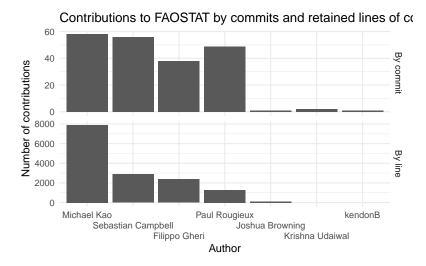

Figure 4: Contributions to the FAOSTAT git repository by number of commits and by number of lines contributed that remain in the current master branch

While there have been other contributors, they have only provided occasional commits and very little of that code remains in the codebase (Figure 4). The major four maintainers (Kao, Gheri, Rougieux and Campbell) are by far the main contributors.

The package's development can be split into two major periods. Between 2013 and 2017 (Figure 5), the package is focused on the Statistical Yearbooks and the FAOSTAT3 API. However, as the package is no longer used for the yearbook and the API is discontinued, the focus is changed to the bulk download functionality to download whole datasets at once.

# **Identified problems**

The FAOSTAT package has only a shadow of its former functionality. While it has retained the ability to download and process zip files (bulk downloads) and country code processing functions, 14 its capacities are limited by the following issues:

<sup>&</sup>lt;sup>14</sup> For a full description of the status of individual issues, please see the GitLab issue #20 Remove functions linked to defunct uses of FAOSTAT

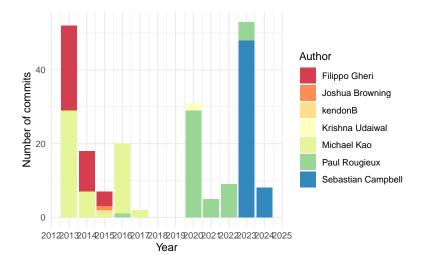

Figure 5: Contributions to the FAOSTAT git repository over time by author

## Functionality locked to the Statistical Yearbook

A number of functions are simply designed to pull in data from other sources such as the World Bank and to process that data into a format easily consumed by the Statistical Yearbook. As the yearbook no longer uses the FAOSTAT package, these functions have no further purpose, serving only to clog up the package and its help files.

# Functionality powered by local files

Many uses of FAOSTAT require data outside of the data that comes directly from FAOSTAT. The major use case is for code conversions. There are two main code types that require conversion:

- Country codes
  - **FAO**: FAO's internal codes for countries<sup>15</sup>
  - M49: The UN standard country codes
  - ISO2 & ISO3: 2 and 3 letter country codes
- · Item codes
  - FAO: Internal FAO codes to describe commodities

<sup>15</sup> For further details about FAO and how it handles country identification, see FAO's NOCS database

CPC: Central Product Classification code (United Nations Statistical Division 2005)

The conversions are not dynamically taken from the API but rather stored in a fixed file. This makes them vulnerable to code or name changes in the future such as the name change of Swaziland to Eswatini in 2018 (United Nations 2018).

#### Inactive API

The FAOSTAT package is currently configured to access a now-defunct API<sup>16</sup> (FAOSTAT3). As a result, it has no methods of retrieving data from the FAOstat platform with the sole exception of the bulk zip downloads which have been since adapted to use the current platform.

<sup>16</sup> Originally hosted at faostat3.fao.org

#### Other issues

The FAOSTAT package is currently maintained by Paul Rougieux who has done an excellent job of keeping the package afloat. However, it is a small project done in his free time, so he has not been able to make the time to do a full overhaul. In addition, he is not an employee of FAO, but rather of the European Commission. As a face that FAO shows to the world, it seems reasonable that it be placed under its guidance.

As the package is old, it also has a number of dependencies that are unused or will be after redundant functions are removed. Other dependencies are simply no longer developed or have been superseded by newer packages.

# Important

This section needs the following structure

- Problems
  - Problem description
- Solutions
  - Brief recap of problem

- Full detail of solution

# **Project goals**

There are four main goals of this project:

- Fix up core functions
- Triage existing functions
- Characterise relevant aspects of the new API to wrap
- Transfer maintainership

#### Fix core functions

The first priority to bring the FAOSTAT package to an acceptable level of functionality is to repair the most basic and most used functions.<sup>17</sup>

Functions should not only be repaired but also renamed to have a consistent naming system.

The functions below have been paired with a corresponding Gitlab issue that gives more context

## Triage existing functions

As described in the Current state section, many functions no longer work and need to be removed. This involves a thorough listing of them and their functionality and assessment of their usefulness.

#### Characterise relevant aspects of the new API to wrap

Full overhauling the package is not in scope for FAOSTAT 2.3.0, but rather reserved for the next major version FAOSTAT 3.0.0.  $^{18}$  This requires the additional step of inspecting the API manually as it doesn't have complete documentation.

<sup>&</sup>lt;sup>18</sup> For a full set of changes expected for FAOSTAT 3.0.0, see the GitLab milestone page

# Transfer maintainership

Uploading a package on CRAN<sup>19</sup> requires the permission of the maintainer. At the upload step, an email is sent to the maintainer of the last recorded package version to confirm that the upload was authorised. Only then can the new version proceed to the registration step.

<sup>19</sup> Comprehensive R Archive Network, the centralised repository where the majority of R users download R packages

# Methods & Discussion

On 2023-03-30, the FAOSTAT package version 2.3.0 was published to CRAN.<sup>20</sup> The process required the resolution of the issues detailed in the Project Goals section.<sup>21</sup>

In order to solve these issues, a full examination of the package context, the API and a redesign of existing functions needed to be made. These efforts permitted the eventual release of FAOSTAT 3.0.0.

# <sup>20</sup> CRAN package page

## Solutions to Identified problems

In the above Identified Problems section, we identified the following issues:

- Functionality locked to the Statistical Yearbook
- Functionality powered by local files
- Inactive API
- Maintainership
- · Old dependencies

# Functionality locked to the Statistical Yearbook

Of all the functions in the FAOSTAT package, we identified eleven functions that we inextricably linked to the Statistical Yearbook. They were either linked to text formatting (e.g. printLab) or obtaining auxiliary data from third party sources like the World Bank (e.g. getWDI). These were all identified<sup>22</sup> and removed<sup>23</sup>.

<sup>&</sup>lt;sup>21</sup> Please see GitLab Milestone 2.3.0 for a full list of related issues

<sup>&</sup>lt;sup>22</sup> GitLab issue #20

<sup>23</sup> Commit e1f0a910

For the most part, they could be easily identified by the use of "SYB" in the function name or reference to non-FAO sources like the World Bank.

# Learning package context

The two most important developers of the FAOSTAT package are the package author, Michael Kao and the current maintainer, Paul Rougieux.

Paul Rougieux has been very helpful in guiding the author's proposed changes to the package - making excellent suggestions in regards to code style and formatting as well as documentation and general usability.

An interview with the Michael Kao<sup>24</sup> clarified that a number of of unusual functions were due to its previous linkage with the Statistical Yearbook and that the paper attached to the package had never been published and suggested that it should be tidied up and published in future.

<sup>24</sup> Personal Communication, 2023

# **Examining the API**

The API is not fully documented and this is mostly because it is not intended for interactive use. The only official consumer of the API is the FAOstat web application itself. The main documentation is a JSON:API specification,<sup>25</sup> which describes the structure perfectly, but gives no context or recommendations for use, nor does it describe output. This is intentional as the servers which provide the API are not equipped to handle the load that a publically available API would inflict.<sup>26</sup>

It was thus necessary to use this document to manually examine all the endpoints and characterise all the the data output from them.  $^{27}$ 

<sup>&</sup>lt;sup>25</sup> JSON:API is a standard way to describe the structure of an API as a single ison document

<sup>&</sup>lt;sup>26</sup> Personal communication, 2023

<sup>&</sup>lt;sup>27</sup> A full set of this examination is found in GitLab issue #23

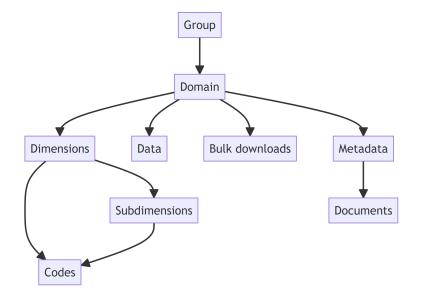

Figure 6: A broad structure of the FAO-stat API package

#### **API** structure

The API is has two main components: dimensions and data (Figure 6). Domains are the objects that hold data itself and these are clustered into groups. Groups link thematically connected domains. These groups correspond to the various internal teams within FAO that are responsible for disseminating data. Dimensions and subdimensions for the definitions for the shape of the data. These are defined separately and can be applied to multiple domains. In addition there are utility endpoints:

- /ping simple check to see if the server is up
- /datasize Appended to the end of queries, returns the size of the data

#### **Domain functions**

list\_domain\_documents read\_domain # read information about a domain /dimensions/{domain\_code} read\_domain\_definitions # read\_domain\_metadata #/metadata/{domain\_code} X - read\_fao # /data/{domain} X - - alias read\_domain\_data

bulk downloads

<sup>&</sup>lt;sup>28</sup> Personal communication, 2024

#### **Definitions functions**

list\_definitions # /definitions/types read\_definition # /definitions/types/{type}

#### Utility

datasize X - ping

#### Search

search suggestions

# **Achieving project goals**

### **Redesigning functions**

The existing functions to be refactored to read data from the new API. FAOSTAT 2.3.0 only has core functions in scope.<sup>29</sup> The most core functions include:

- $getFAO^{30}$  The heart of the package, pulls a custom slice of data from FAOstat. Renamed to read\_fao
- FAOsearch<sup>31</sup> Allows a user to find the dataset they're looking for using the directory in FAOstat. Renamed to search\_fao
- translateCountryCode<sup>32</sup> Translates country codes between formats. Renamed to translate\_countrycodes

# Consequent work

The above changes sometimes entailed additional work due to unforeseen problems or hidden requirements

<sup>&</sup>lt;sup>29</sup> A full list of functions to be refactored or discarded is in GitLab issue #20

<sup>30</sup> GitLab issue #16

<sup>31</sup> GitLab issue #22

<sup>32</sup> GitLab issue #28

#### **Function regression**

It was intended that the bulk zip download files remained intact, as they were the most functional part of the package. However, it depends on FAOsearch/search\_fao which was changed as part of the 2.3.0 release. As a result, it was necessary to refactor some of the bulk download code to restore functionality.

#### Caching

One of the drawbacks of moving from internal data to pulling from the API is the need to read in data every time a lookup table or other piece of reference data is required. This slows down scripts as it's forced to wait for a reply from the FAOstat server. To mitigate that, caching was implemented. <sup>33</sup> Now instead of pulling every time, the server is polled only once and the response is kept and referred to for subsequent queries.

33 GitLab issue #27

#### Metadata functions

When using the package, it was found that certain functionalities were immediately necessary. It was nigh-impossible to practically make a request for data without knowing what datasets were available and what their column names were. As a last minute addition, functions to perform these tasks were slipped into the 2.3.0 release. https://gitlab.com/paulrougieux/faostatpackage/mmit 06548dd0 /commit/06548dd0a74e1075469aece12f0bf2f8df4a3f11)]

#### **Testing**

When making changes to a codebase it's important to make tests to assure that the function works as intended but also to report when the function breaks as a result of changes to it or its dependencies. This package uses testthat for its tests (Wickham 2011).

Making tests is repetitive work however and many tests are structured the same way. This sort of repetitive intellectual work is perfect for an AI. The author used ChatGPT to help generate tests.<sup>35</sup> It was supplied with the function code and responded with valid tests from which relevant ones were selected.

35 ChatGPTv3 conversation dated 2023-03-28

#### **Documentation**

The package is documented using roxygen2 (Wickham et al. 2022) which allows documentation and code to be kept in the same file. Documentation has been particularly important for this project, specifically examples. As a lot of information has to be supplied to a function to get data in terms of codes, it's important that users have a clear idea of what is required as incorrect codes can result in cryptic empty responses from the server.

# **Examples of use**

#### **Future work**

API wrappers like the FAOSTAT package require a substantial amount of work and are very specific to a particular service. Furthermore, there's no standard to how they should be created, meaning that even two wrappers to the same API have completely different approaches. Another approach is to have a standardised "wrapper" for the user and develop multiple config files to each allow connecting to a different API (Wu et al. 2023).

# Important

Maybe we should consider using a non-wrapper approach such as Web Connector

#### **Publication**

The FAOSTAT package has never been officially published and it's important to widely publicise it to encourage use. The following

avenues are available:

- Publishing a paper in JOSS JOSS is an online journal with peer review entirely managed by github issues
- Publish news in rweekly Rweekly is a weekly newsletter that publishes news about R in the last week
- Publish FAO news alert FAO has internal news services and a FAO product should be publicised through it
- Move package to FAO repository The package is currently hosted on GitLab and should ideally be moved to a repository with FAO branding such as the the GitHub FAOSTAT organisation.

# **Funding declaration**

This project has been funded by the Food and Agriculture Organization of the United Nations and the author is grateful for their help in reviving it.
